

Package: strat (via r-universe)

September 8, 2024

Type Package

Title An Implementation of the Stratification Index

Version 0.1

Description An implementation of the stratification index proposed by Zhou (2012) <[DOI:10.1177/0081175012452207](https://doi.org/10.1177/0081175012452207)>. The package provides two functions, `srank`, which returns stratum-specific information, including population share and average percentile rank; and `strat`, which returns the stratification index and its approximate standard error. When a grouping factor is specified, `strat` also provides a detailed decomposition of the overall stratification into between-group and within-group components.

Depends R (>= 3.3.1),

Imports Hmisc (>= 4.0-0), Rcpp, stats

LinkingTo Rcpp, RcppArmadillo

License GPL (>= 3)

--------------	----------

cpsmarch2015	<i>A Subset of March CPS 2015 Sample</i>
--------------	--

Description

A dataset containing income, big class, microclass, and education of 14,358 male respondents from March CPS 2015

Usage

```
cpsmarch2015
```

Format

A data frame with 14358 rows and 5 variables:

income personal market income, in US dollars

big_class big class membership

micro_class microclass membership

education educational attainment

weight sampling weight given by CPS

print.srank	<i>Print an object of class srank</i>
-------------	---------------------------------------

Description

Print an object of class srank

Usage

```
## S3 method for class 'srank'
print(x, digits = 3, ...)
```

Arguments

x	An object of class srank
digits	the number of significant digits to use when printing
...	further arguments passed to or from other methods

print.strat	<i>Print an object of class strat</i>
-------------	---------------------------------------

Description

Print an object of class strat

Usage

```
## S3 method for class 'strat'
print(x, digits = 3, ...)
```

Arguments

x	An object of class strat
digits	the number of significant digits to use when printing
...	further arguments passed to or from other methods

srank	<i>Ranking strata.</i>
-------	------------------------

Description

Ranking strata according to the average percentile rank of members in each stratum.

Usage

```
srank(outcome, strata, weights = NULL, group = NULL)
```

Arguments

outcome	A numeric vector of outcome.
strata	A vector of length(outcome) indicating strata membership. The elements are coerced to factors by factor .
weights	An optional vector of weights.
group	An optional grouping factor.

Value

An object of class srank.

raw	a data frame consisting of complete cases of all inputs.
summary	a data frame of stratum-specific information, including name, population share, and average percentile rank.

Examples

```
strata_info <- with(cpsmarch2015, srank(income, big_class,
  weights = weight, group = education))
print(strata_info, digits = 3)
```

strat	<i>Stratification index.</i>
-------	------------------------------

Description

strat computes the stratification index proposed in Zhou (2012). When group is specified, it also returns between-group and within-group components of the overall stratification.

Usage

```
strat(outcome, strata, weights = NULL, ordered = FALSE, group = NULL)
```

Arguments

outcome	A numeric vector of outcome.
strata	A vector of length(outcome) indicating strata membership. The elements are coerced to factors by factor .
weights	An optional vector of weights.
ordered	Logical. If TRUE strata are pre-ordered ascendingly.
group	An optional grouping factor. If specified, strat also returns between-group and within-group components of the overall stratification.

Value

An object of class strat.

overall	a vector of two, giving computed stratification index and approximate standard error.
strata_info	a data frame of stratum-specific information, including name, population share, and average percentile rank.
decomposition	between-group and within-group components of the overall stratification.
within_group	within-group indices of stratification by group.

Zhou, Xiang. 2012. "A Nonparametric Index of Stratification." *Sociological Methodology*, 42(1): 365-389.

Examples

```
s <- with(cpsmarch2015, strat(income, big_class,  
  weights = weight, group = education))  
print(s, digits = 4)  
print(s$strata_info, digits = 4)  
print(s$within_group, digits = 4)
```
